# MealSenseAI Project Proposal

Proposal · MealSenseAI · Joselito Dizon · 2026-06-20

*A photo-based meal logger that recognises foods, estimates nutrition and explains its confidence, aimed at people managing their diet.*

## Problem

Logging meals by hand is tedious, and people managing diabetes or weight need nutrition estimates they can trust and understand.

Local dishes in Singapore are poorly covered by generic food apps.

## Proposed solution

MealSenseAI recognises foods from a photo, segments multi-food plates, estimates portions and nutrients, and explains each result.

Recognition is trained on Food-101 and FoodSG-233; see the Food-101 dataset notes and the FoodSG-233 dataset notes.

A grounded Meal Advisor answers questions using only the user's meals, the food table and approved guidance.

## Safety

The app never gives medication or insulin advice, and every estimate is labelled as an estimate.

Health information is used only with explicit consent.
