Guidance Notes: Glycaemic Index and Glycaemic Load

Guidance notes · MealSenseAI · Joselito Dizon · 2026-07-30

Educational notes on glycaemic index and load, drawn from the international GI tables and diabetes care standards.

Definitions

Glycaemic index ranks carbohydrate foods by how quickly they raise blood glucose compared with a reference.

Glycaemic load multiplies the index by the grams of available carbohydrate in a portion, so portion size matters.

Sources

Values come from the international tables of glycaemic index and glycaemic load values (Atkinson and colleagues, 2021).

General dietary guidance follows the American Diabetes Association Standards of Care.

Use in MealSenseAI

Foods without a published index use an assumed value, and the app says so.

These notes inform the forecast described in the MealSenseAI Solution Architecture.
