Sustainability Report 2024

Larkspur Logistics · Maren Okafor · 24 February 2025

Our footprint

In 2024 our 290 Wren robots used 412 megawatt-hours of electricity, 68 percent from renewable sources through customer green tariffs. Each robot's battery is designed for 3,000 charge cycles and is refurbished rather than replaced.

Warehouses we help

Customer sites using Wren cut lighting energy in back aisles by an average of 23 percent, because robots do not need full lighting at night. Shorter walking routes also reduced forklift trips at mixed sites.

Goals for 2025

Reach 85 percent renewable charging, publish battery recycling results, and design Wren 2 with 30 percent recycled aluminium.
