Intelligent Reasoning Systems: Practice Module Brief

Prepared by NUS-ISS teaching team

What each group must build and submit, and how it will be assessed.

Purpose

The NUS-ISS practice module starts on 6 July 2026. Each group designs and builds an intelligent reasoning system that solves a real problem for a real user, combining at least two reasoning techniques.

Deliverables

Groups submit a report, a runnable demo and a short video by 30 November 2026. The demo must start with documented commands on a clean machine.

Every answer a system gives should carry its Provenance: markers must be able to trace an output back to the evidence it used. Systems are expected to practise Explainable AI, not merely produce outputs.

Assessment

Marks reward problem framing, technical depth, the quality of the reasoning and Model Evaluation against a ground truth. A mid-term presentation in October 2026 checks progress.
