Guidance Notes: Glycaemic Index and Glycaemic Load

Prepared by Joselito Dizon

Educational notes on glycaemic index and load, and how they inform MealSenseAI's estimates.

Definitions

These notes were compiled on 30 July 2026. Glycaemic index ranks carbohydrate foods by how quickly they raise blood glucose compared with a reference food. Glycaemic load multiplies the index by the grams of available carbohydrate in a portion, so portion size matters as much as the food.

Sources

Index values come from the international tables of glycaemic index and load published by Atkinson and colleagues. General guidance follows the American Diabetes Association Standards of Care, and the World Health Organization's advice on free sugars and fibre.

Use in MealSenseAI

Glycaemic Response in the app is educational. Nutrition Estimation supplies the carbohydrate; foods without a published index use an assumed value, and the app says so. Nothing here is advice on medication.
