EXP-002 Model Evaluation Report

Prepared by Joselito Dizon

Developer-reported accuracy of the EXP-002 food classifier and the ONNX runtime parity check.

Model

This report was issued on 18 August 2026. EXP-002 is the Food Recognition model used by MealSenseAI, trained on the merged Food-101 and FoodSG-233 taxonomy.

Results

Developer-reported results are 70.63% top-1 accuracy, 85.66% top-3 accuracy and 66.68% macro-F1.

Roughly three photos in ten get a wrong top-1 class. That is why the app shows alternatives and asks the user to confirm: Explainable AI turns a known error rate into a correction step instead of a hidden failure.

Runtime parity

Model Evaluation also checked the ONNX Runtime export against the original checkpoint on six hundred and one images: top-1 and top-3 agreement was complete. Parity shows the runtime reproduces the model; it is not an accuracy measurement.

Illustrative sample document for the CEREBRO demo library.
