Galaxy Design Notes: Co-occurrence, Not Claims

Prepared by Joselito Dizon

Why the Galaxy shows what documents share rather than what a model believes they mean.

Principle

Written on 22 October 2026. The Galaxy is CEREBRO's view of Knowledge Graphs, but its edges only say what the data supports: two confirmed topics appear in the same registered document.

Why not infer relationships

A label like 'depends on' would be a claim no evidence here supports. Explainable AI means every edge can answer 'why is this drawn?' with the documents behind it.

Each edge therefore carries its Provenance: the documents it rests on, and how many.

Making it readable

Clusters open first and fragments arrive on demand. An edge backed by a single document is kept but drawn only when one of its ends is selected, so the opening view shows links that recur.

A library seeded with related documents shows this best: a shared vocabulary of topics produces recurring edges instead of isolated islands.

Illustrative sample document for the CEREBRO demo library.
